In the remainder of this book we describe this progress and the considerable challenges that await us as we strive to develop these models so that we can simulate how cities may develop with time with a view to testing scenarios for improving their future sustainability. In this we start with the relatively simple problem of identifying urban geometry in urban modeling, even from a computer graphics perspective, must tie the two areas of geometric and behavioral modeling

together in order to ensure that useful 3D modeling techniques are developed and are placed within their needed context.
